s140056 - Mohammed Ahmed Al-Jabri

TABLE OF CONTENTS

1. Overview
 2. CLIENT-SIDE VALIDATION
 3. DATABASE DESIGN
 4. PHP IMPLEMENTATION
 5. TEAM COLLABORATION
- 

1. OVERVIEW

In this fourth and final phase of the MangaMaps project, our team successfully transformed the static website into a dynamic, data-driven web application. We integrated **PHP** for server-side processing and **MySQL** for persistent data storage. The application now supports full CRUD (Create, Read, Update, Delete) operations, secure form handling, and object-oriented programming principles to manage tour data efficiently.

2. CLIENT-SIDE VALIDATION

We enhanced user experience and data integrity by implementing robust JavaScript validation on two key forms before data is sent to the server.

- **A. Booking Form Validation (`booking.html`):**
 - **Name:** Regex `^[a-zA-Z\s-]+$` ensures only letters, spaces, and hyphens are allowed.
 - **Email:** Validates standard email formats including domain extensions.
 - **Travelers:** Validates numeric input to ensure the group size is between 1 and 6 people.
 - **Date:** Logic prevents users from selecting past dates for their travel.
- **B. Contact Form Validation (`contact.html`):**
 - **Phone Number:** We implemented a Regex pattern `^[\d\s\-\+\(\)]+$` to accept international formats (including +, parentheses, and hyphens).
 - **Message:** Enforces a minimum character limit (10 characters) to ensure meaningful inquiries.

3. DATABASE DESIGN

We designed and implemented a relational MySQL database named **mangamaps_db** containing three normalized tables to store application data:

- **tours Table:** Stores tour details including id, name, price, duration, and image_url.
- **bookings Table:** Captures form submissions with columns for full_name, email, destination, travelers, travel_date, and special_requests.
- **reviews Table:** Stores user feedback with reviewer_name, rating (1-5), and comment.

	Table	Action	Rows
<input type="checkbox"/>	bookings		6
<input type="checkbox"/>	reviews		5
<input type="checkbox"/>	tours		3
3 tables		Sum	14

← ↑ →		id	full_name	email	destination	trav

	<input checked="" type="checkbox"/>							assets/images/osaka (1).jpg
	<input checked="" type="checkbox"/>							assets/images/kyoto.jpg

4. PHP IMPLEMENTATION

We developed several PHP scripts to handle logic, data processing, and display.

- **A. Connection Handling (`db_connect.php`):**
 - Created a centralized connection file using the `mysqli` object to establish secure communication with the database. This file is included in all processing scripts to reduce code redundancy.
- **B. Form Processing (`process_booking.php`):**
 - Receives data via the POST method.
 - Sanitizes input using `real_escape_string` to prevent SQL Injection attacks.
 - Inserts booking details into the bookings table.
 - Displays a formatted HTML confirmation table upon success.
- **C. Object-Oriented Display (`view_tours.php`):**
 - **Class Definition:** Defined a `Tour` class with properties for name, price, duration, and image.
 - **Array of Objects:** Fetched raw rows from the database and converted them into an array of `Tour` objects.
 - **Display Logic:** Iterated through the object array to generate dynamic HTML cards for the "Our Tours" page.
- **D. Data Management System (`manage_tours.php & edit_tour.php`):**
 - **Search:** Implemented a search feature using SQL LIKE queries to filter tours by name.
 - **Insert:** Created a form to add new tours directly to the database.
 - **Delete:** Added functionality to remove records via ID URL parameters.
 - **Update:** Developed an edit interface that pre-fills existing data and updates records using SQL UPDATE commands.

5. TEAM COLLABORATION

5.1 Meeting Log To ensure the successful completion of Phase 4, our team conducted two major planning and development meetings:

- **Meeting 1 (Validation Phase):** Focused on analyzing the requirements for client-side validation. We divided the work for booking.html and contact.html, determining the appropriate Regex patterns for names, emails, and phone numbers.
- **Meeting 2 (Server-Side Phase):** Focused on the backend architecture. We planned the MySQL database schema and the PHP logic for form processing and object-oriented display. We also debugged the connection issues together.

5.2 Contribution Table

Task	Team Member	% Contribution	Description of Work
JS Validation Logic	Loai & Mohammed	50% / 50%	Collaborated on writing Regex patterns and error handling for Booking and Contact forms.
Database & PHP	Loai & Mohammed	50% / 50%	Jointly designed the mangamaps_db schema and wrote the process_booking.php script.
OOP & Data Access	Loai & Mohammed	50% / 50%	Worked together to implement the Tour class and the Search/Edit/Delete functionality.
Report & Documentation	Loai	100%	Compiled the final project report, organized screenshots, and finalized submission files.
